What if Amazon's rainfall regime changes?

Projection: South America Equalistant Conic

The data in this map represents 2010 layers, for 1990, 2000, and 2010 w/ Global Rural-Urban Mapping Project, were created by dividing the 1990, 2000, and 2010 population (POP) count grids by the 4 values for the resulting grid layers, of 2010, were then aggregated to form classes. Population of the Southeast and South of Brazil: **108 million people.**

South of Amazonia: agriculture and food security.

Amazon rainforest hit by second 'once in a century drought' in five years

By DAVID DERBYSHIRE FOR MAILONLINE
UPDATED: 09:01 BST, 4 February 2011

Precipitation Anomaly – September

2010

2015

Goal:

Verify how Amazon's cloud life cycle and rainfall regime has changed over the years and explore the possible drivers and consequences of these changes.

Questions:

- What is happening to clouds in Amazonia?
- How are these variations linked to meteorological variables over the region?
- What is happening to the rainfall regime in Amazonia?
- What are some of the potential drivers of these changes?

Data

International Satellite Cloud Climatology Project (ISCCP)

- 27 years of Cloud fraction retrievals from Geostationary Satellites (1983 – 2009)
- One measurement every 3 hours
- Grid cell: $2.5^{\circ} \times 2.5^{\circ}$

Other data sources

- ERA-Interim and ERA Interim/Land Reanalysis
- Climate indices time series

Goal:

Verify how Amazon's cloud life cycle and rainfall regime has changed over the years and explore the possible drivers and consequences of these changes.

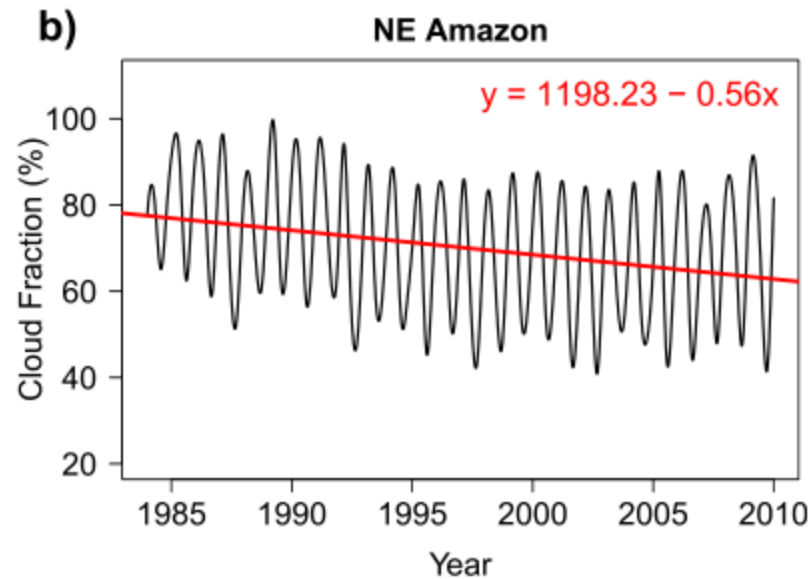

Questions:

- **What is happening to clouds in Amazonia?**
- How are these variations linked to meteorological variables over the region?
- What is happening to the rainfall regime in Amazonia?
- What are some of the potential drivers of these changes?

Mean and standard deviation of Total Cloud Fraction (1983 – 2009)

Time series of Total Cloud Fraction by region

Linear trends – Total CF (1983 – 2009)

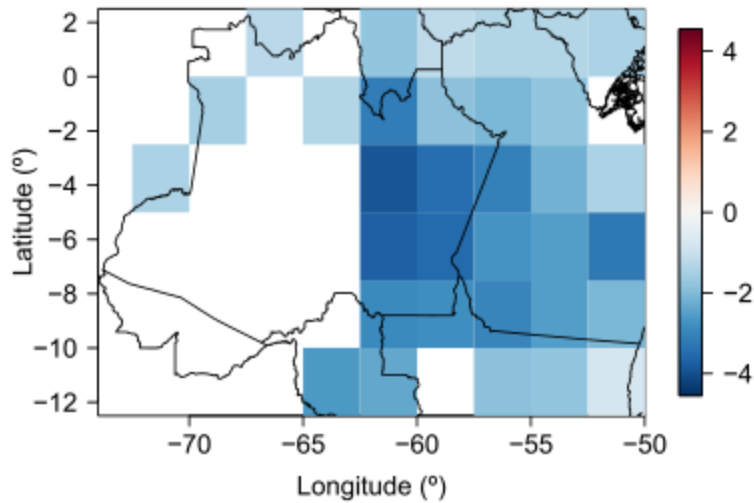

Linear trends – Total CF (1983 – 2009)

Linear trends – High CF (1983 – 2009)

High Cloud Fraction – 0 UTC (%/dec)

High Cloud Fraction – 3 UTC (%/dec)

High Cloud Fraction – 6 UTC (%/dec)

High Cloud Fraction – 9 UTC (%/dec)

Linear trends – High CF (1983 – 2009)

High Cloud Fraction – 12 UTC (%/dec)

High Cloud Fraction – 15 UTC (%/dec)

High Cloud Fraction – 18 UTC (%/dec)

High Cloud Fraction – 21 UTC (%/dec)

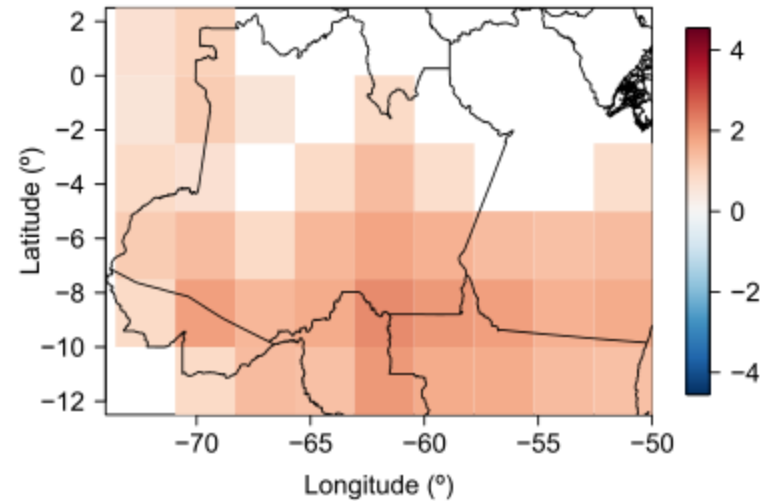

Linear trends – Mid-level CF (1983 – 2009)

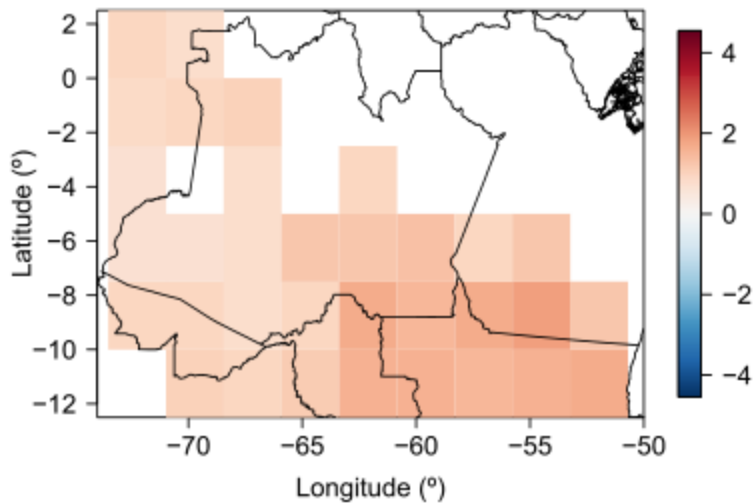

Mid-level Cloud Fraction – 0 UTC (%/dec)

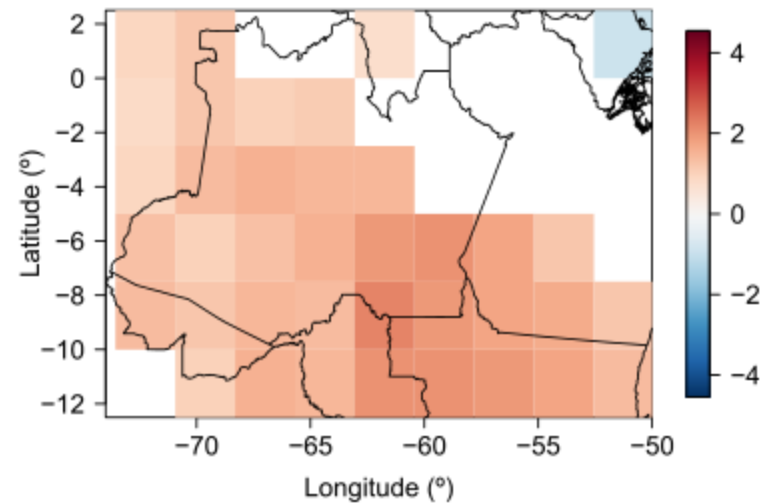

Mid-level Cloud Fraction – 3 UTC (%/dec)

Mid-level Cloud Fraction – 6 UTC (%/dec)

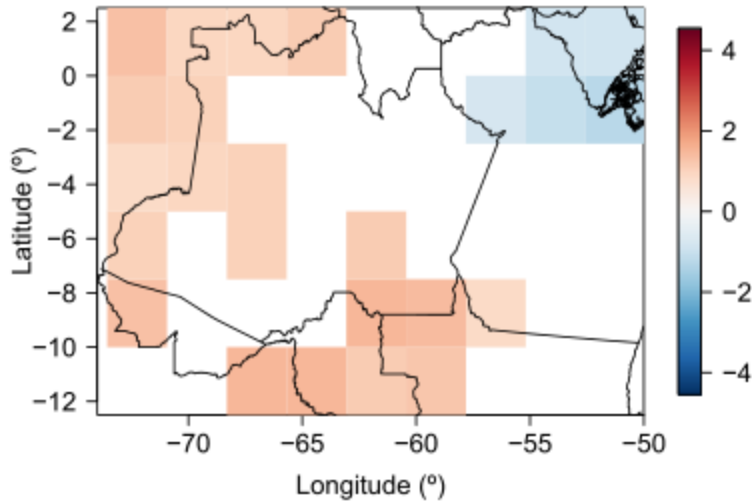

Mid-level Cloud Fraction – 9 UTC (%/dec)

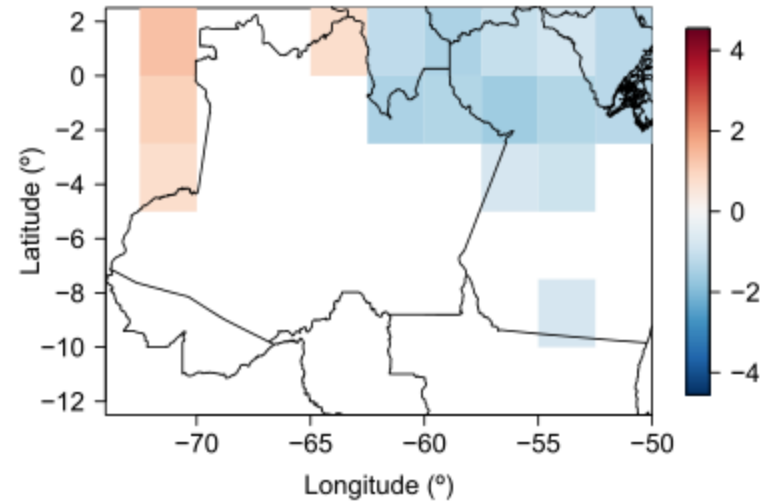

Linear trends – Mid-level CF (1983 – 2009)

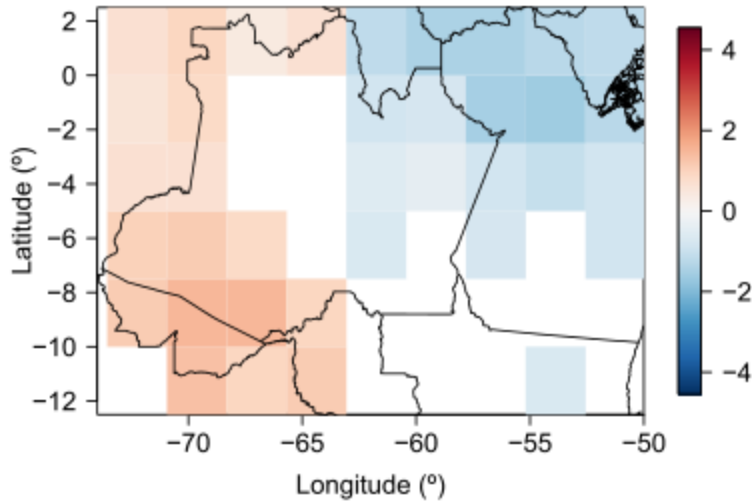

Mid-level Cloud Fraction – 12 UTC (%/dec)

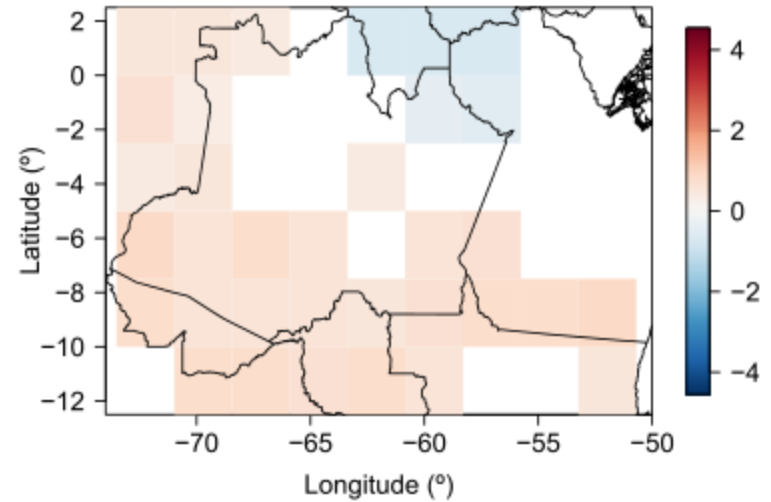

Mid-level Cloud Fraction – 15 UTC (%/dec)

Mid-level Cloud Fraction – 18 UTC (%/dec)

Mid-level Cloud Fraction – 21 UTC (%/dec)

Linear trends – Low CF (1983 – 2009)

Low Cloud Fraction – 0 UTC (%/dec)

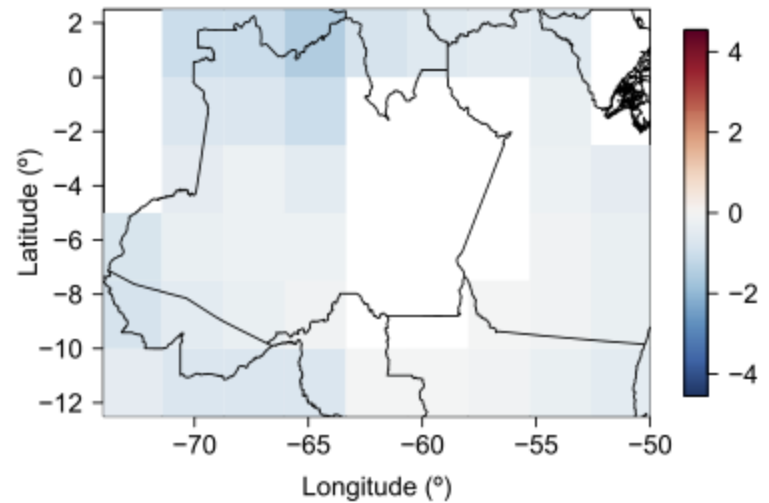

Low Cloud Fraction – 3 UTC (%/dec)

Low Cloud Fraction – 6 UTC (%/dec)

Low Cloud Fraction – 9 UTC (%/dec)

Linear trends – Low CF (1983 – 2009)

Low Cloud Fraction – 12 UTC (%/dec)

Low Cloud Fraction – 15 UTC (%/dec)

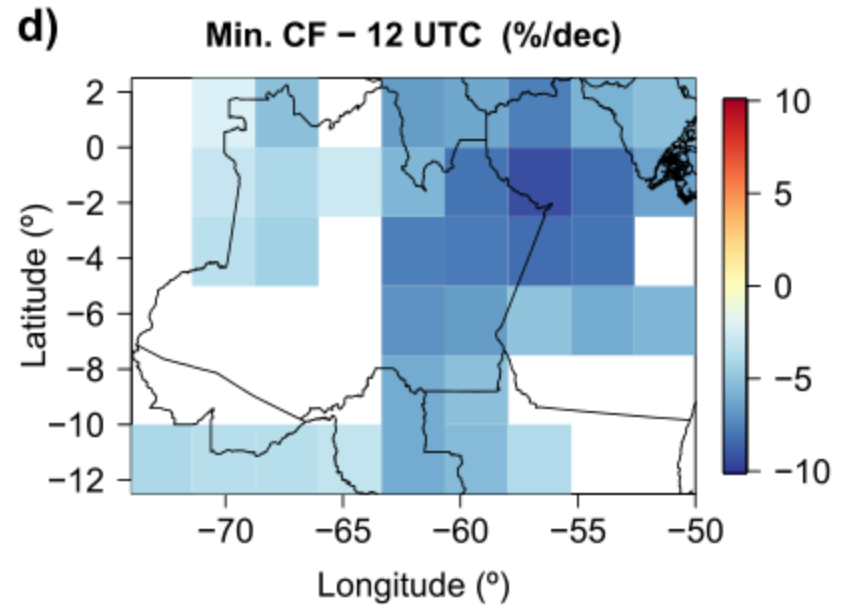

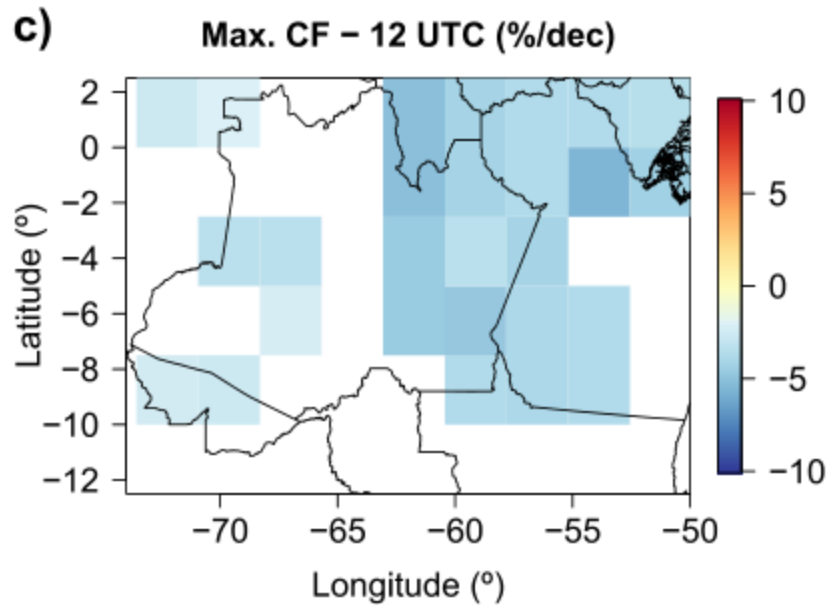

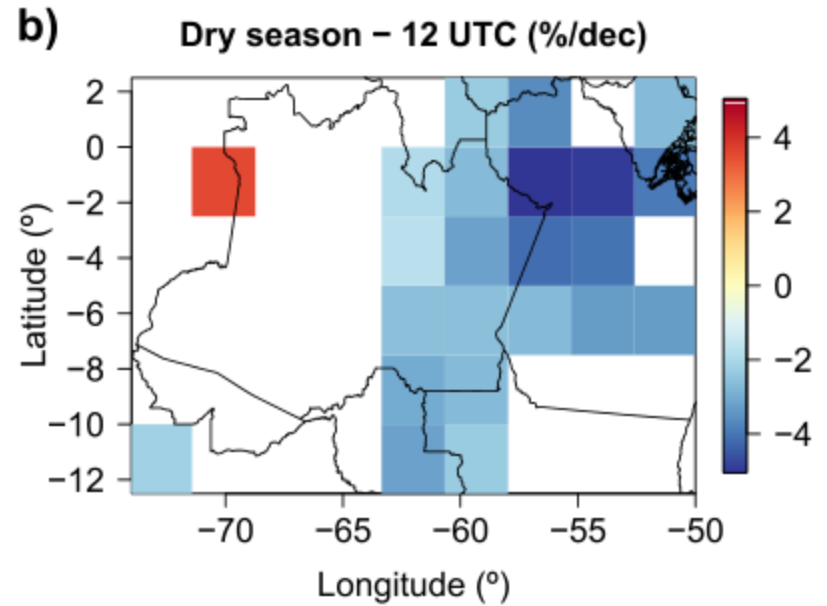

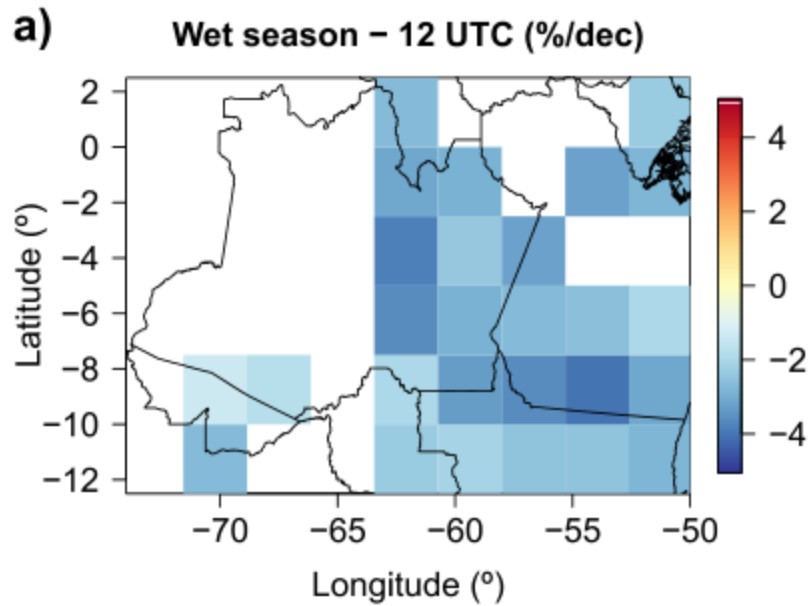

Low Cloud Fraction – 18 UTC (%/dec)

Low Cloud Fraction – 21 UTC (%/dec)

Linear trends (1983 – 2009)

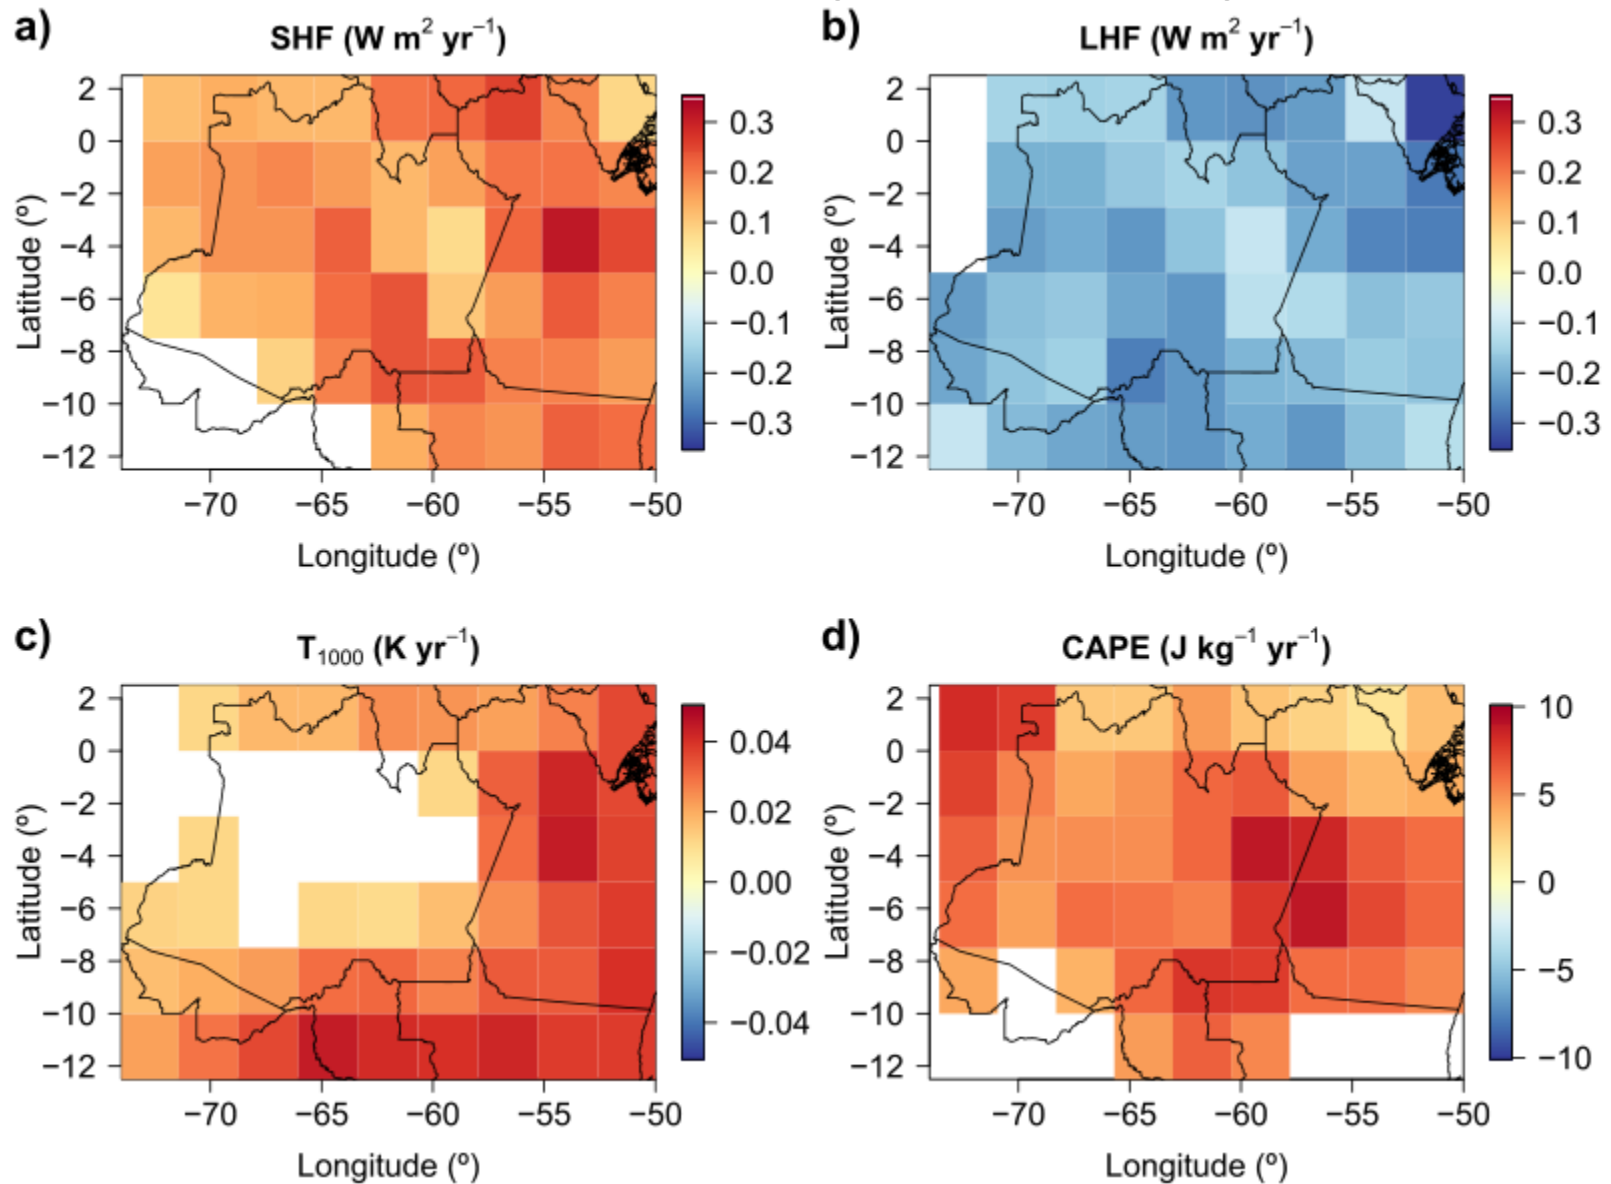

Goal:

Verify how Amazon's cloud life cycle and rainfall regime has changed over the years and explore the possible drivers and consequences of these changes.

Questions:

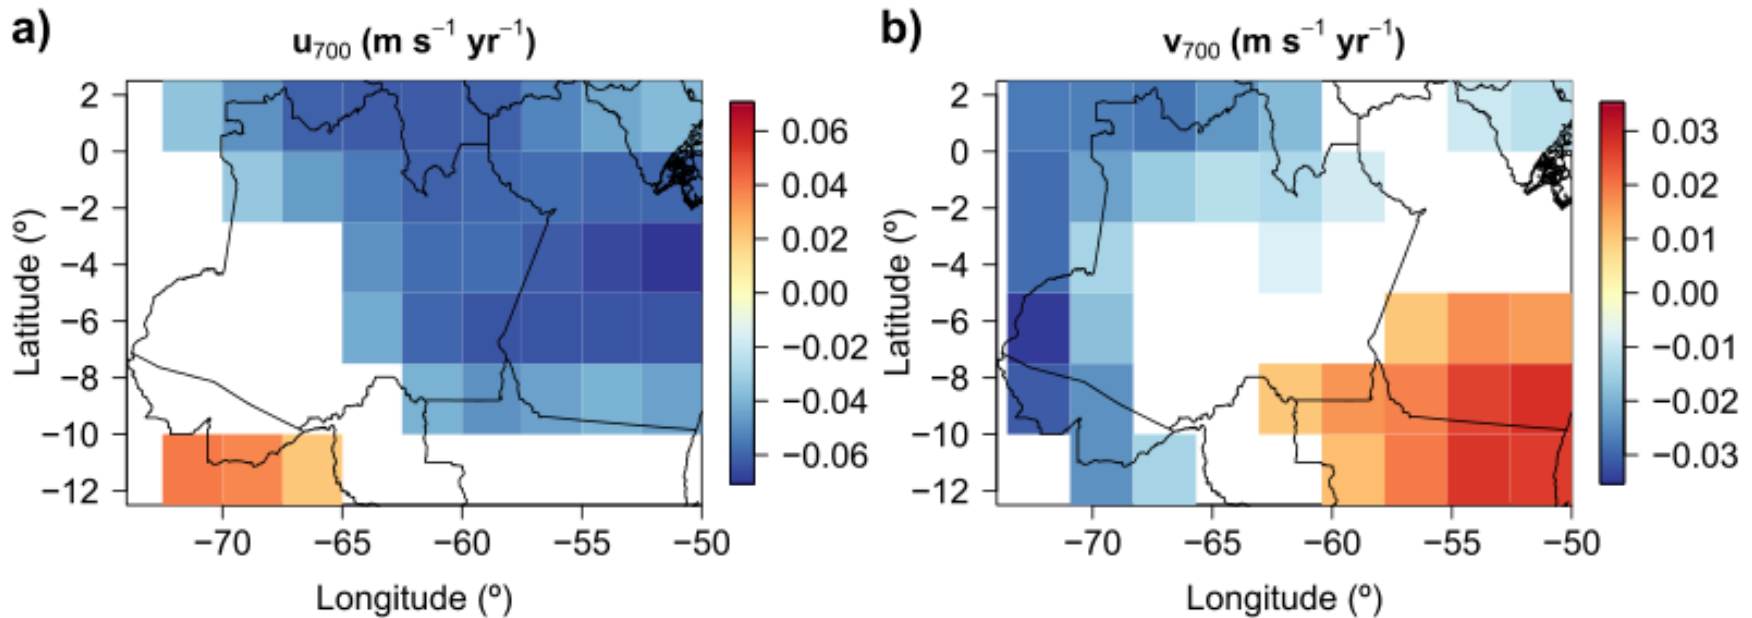

- What is happening to clouds in Amazonia?
- **How are these variations linked to meteorological variables over the region?**
- What is happening to the rainfall regime in Amazonia?
- What are some of the potential drivers of these changes?

Linear trends (1983 – 2009)

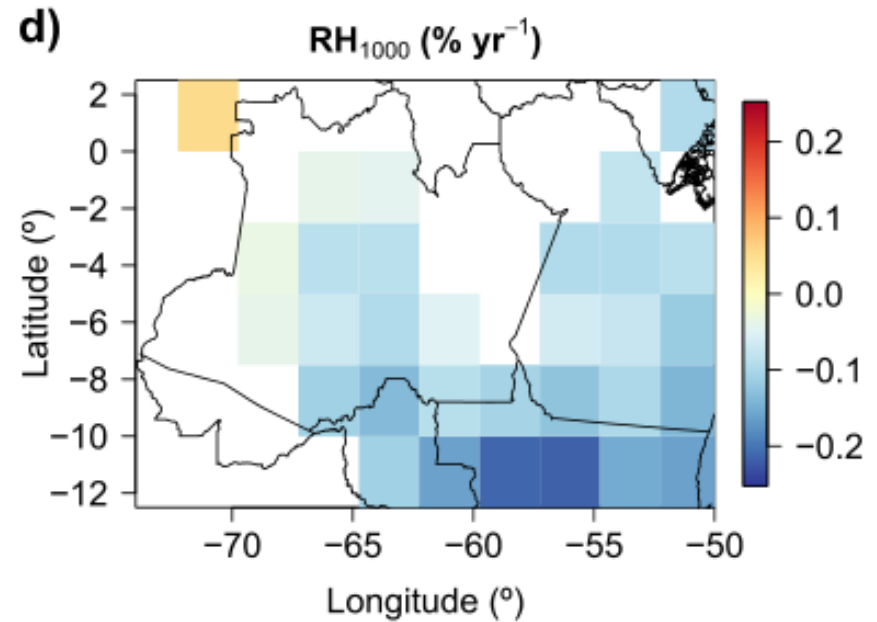

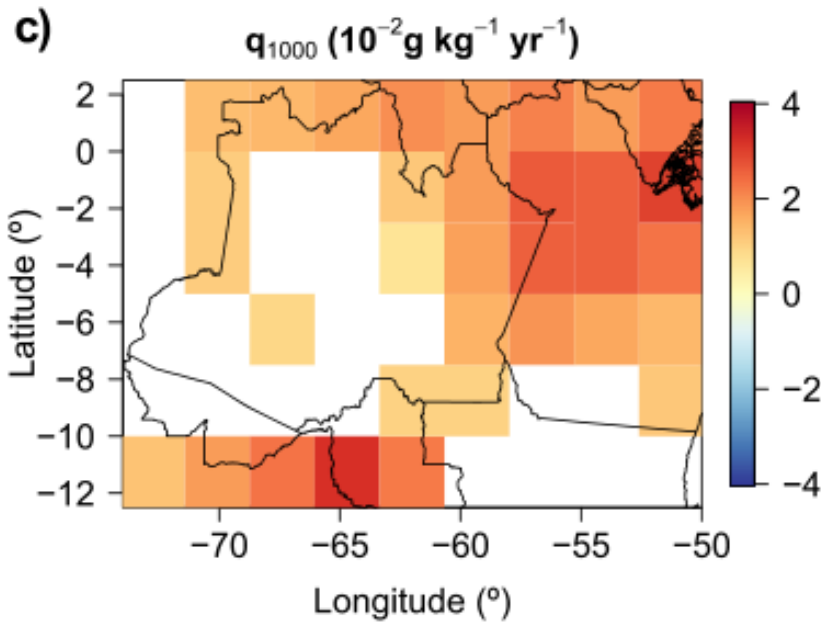

Consistent with decreased cloud fraction.

Linear trends (1983 – 2009)

- Intensification of easterly winds.
- Intensification of northerlies in the NW and weakening of northerlies in the SE.

Linear trends (1983 – 2009)

- Increased specific humidity due to moisture transport from the Atlantic ocean to Amazon.
- Decreased Relative Humidity.

Consistent with decreased cloud fraction.

Goal:

Verify how Amazon's cloud life cycle and rainfall regime has changed over the years and explore the possible drivers and consequences of these changes.

Questions:

- What is happening to clouds in Amazonia?
- How are these variations linked to meteorological variables over the region?
- **What is happening to the rainfall regime in Amazonia?**
- What are some of the potential drivers of these changes?

Methodology

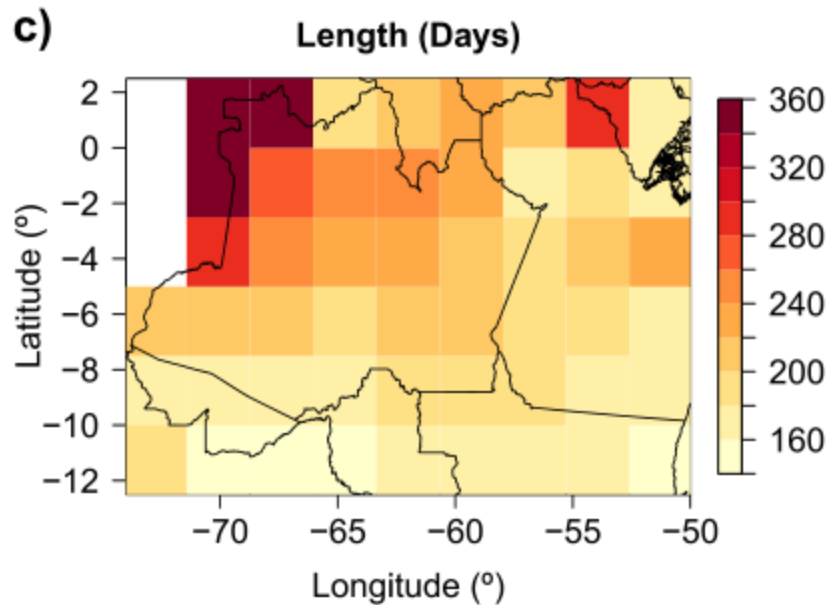

New method to estimate wet season onset, demise and length in Amazon.

Example of smoothed cloud fraction
6.25°S, 56.25°W – 12 UTC (8 LT)

a)**b)****c)****d)**

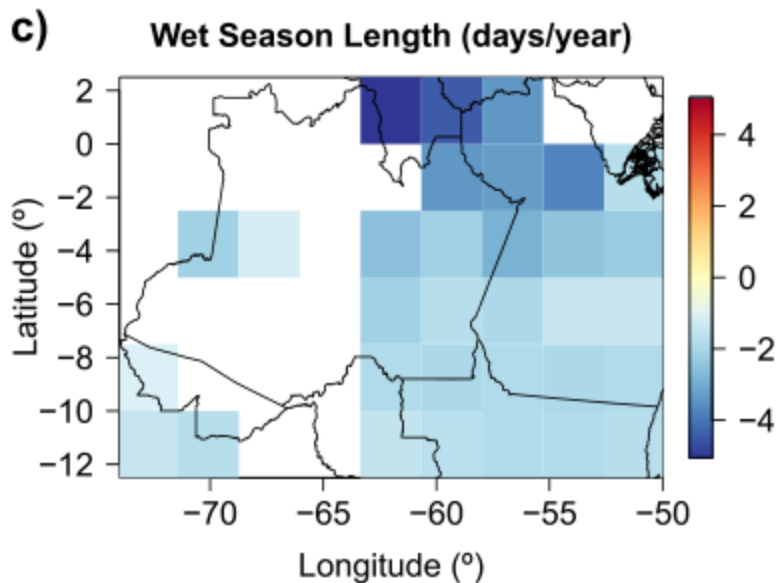

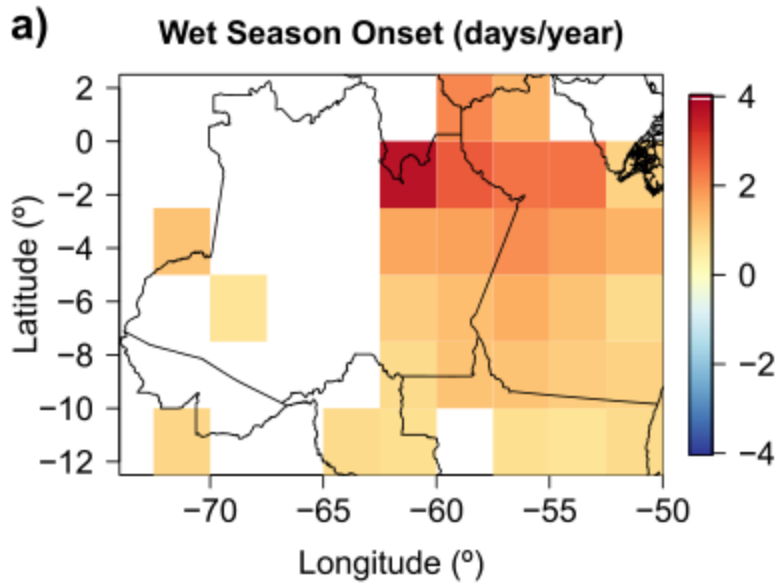

Average (1983 – 2009)

Consistent with previous approaches.

Advantage: Does not rely on rain gauges

Linear trends Onset, Demise and Length (1983 – 2009)

- Delayed onsets
- Earlier demises
- Shorter wet seasons

Large scale influence!!!

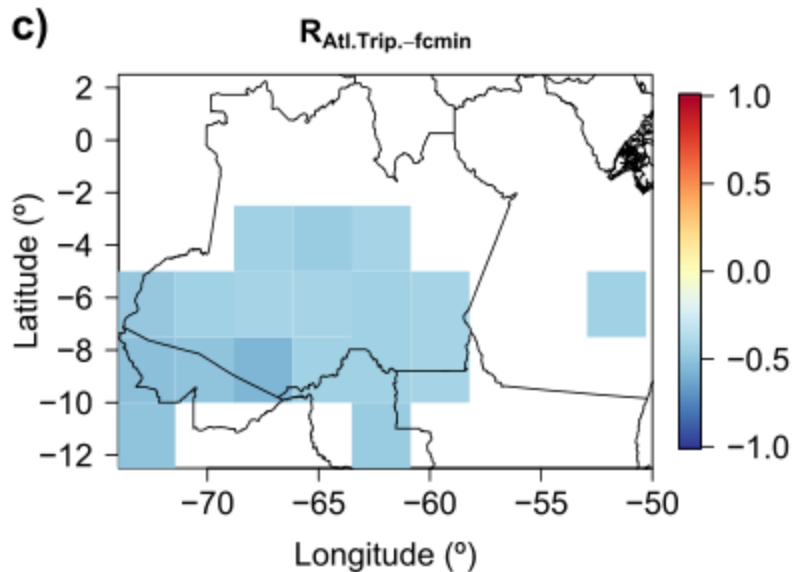

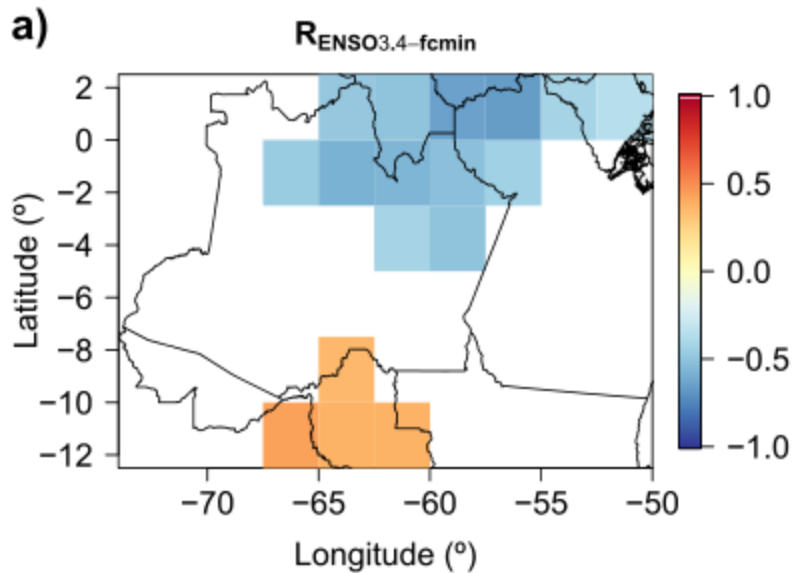

Goal:

Verify how Amazon's cloud life cycle and rainfall regime has changed over the years and explore the possible drivers and consequences of these changes.

Questions:

- What is happening to clouds in Amazonia?
- How are these variations linked to meteorological variables over the region?
- What is happening to the rainfall regime in Amazonia?
- **What are some of the potential drivers of these changes?**

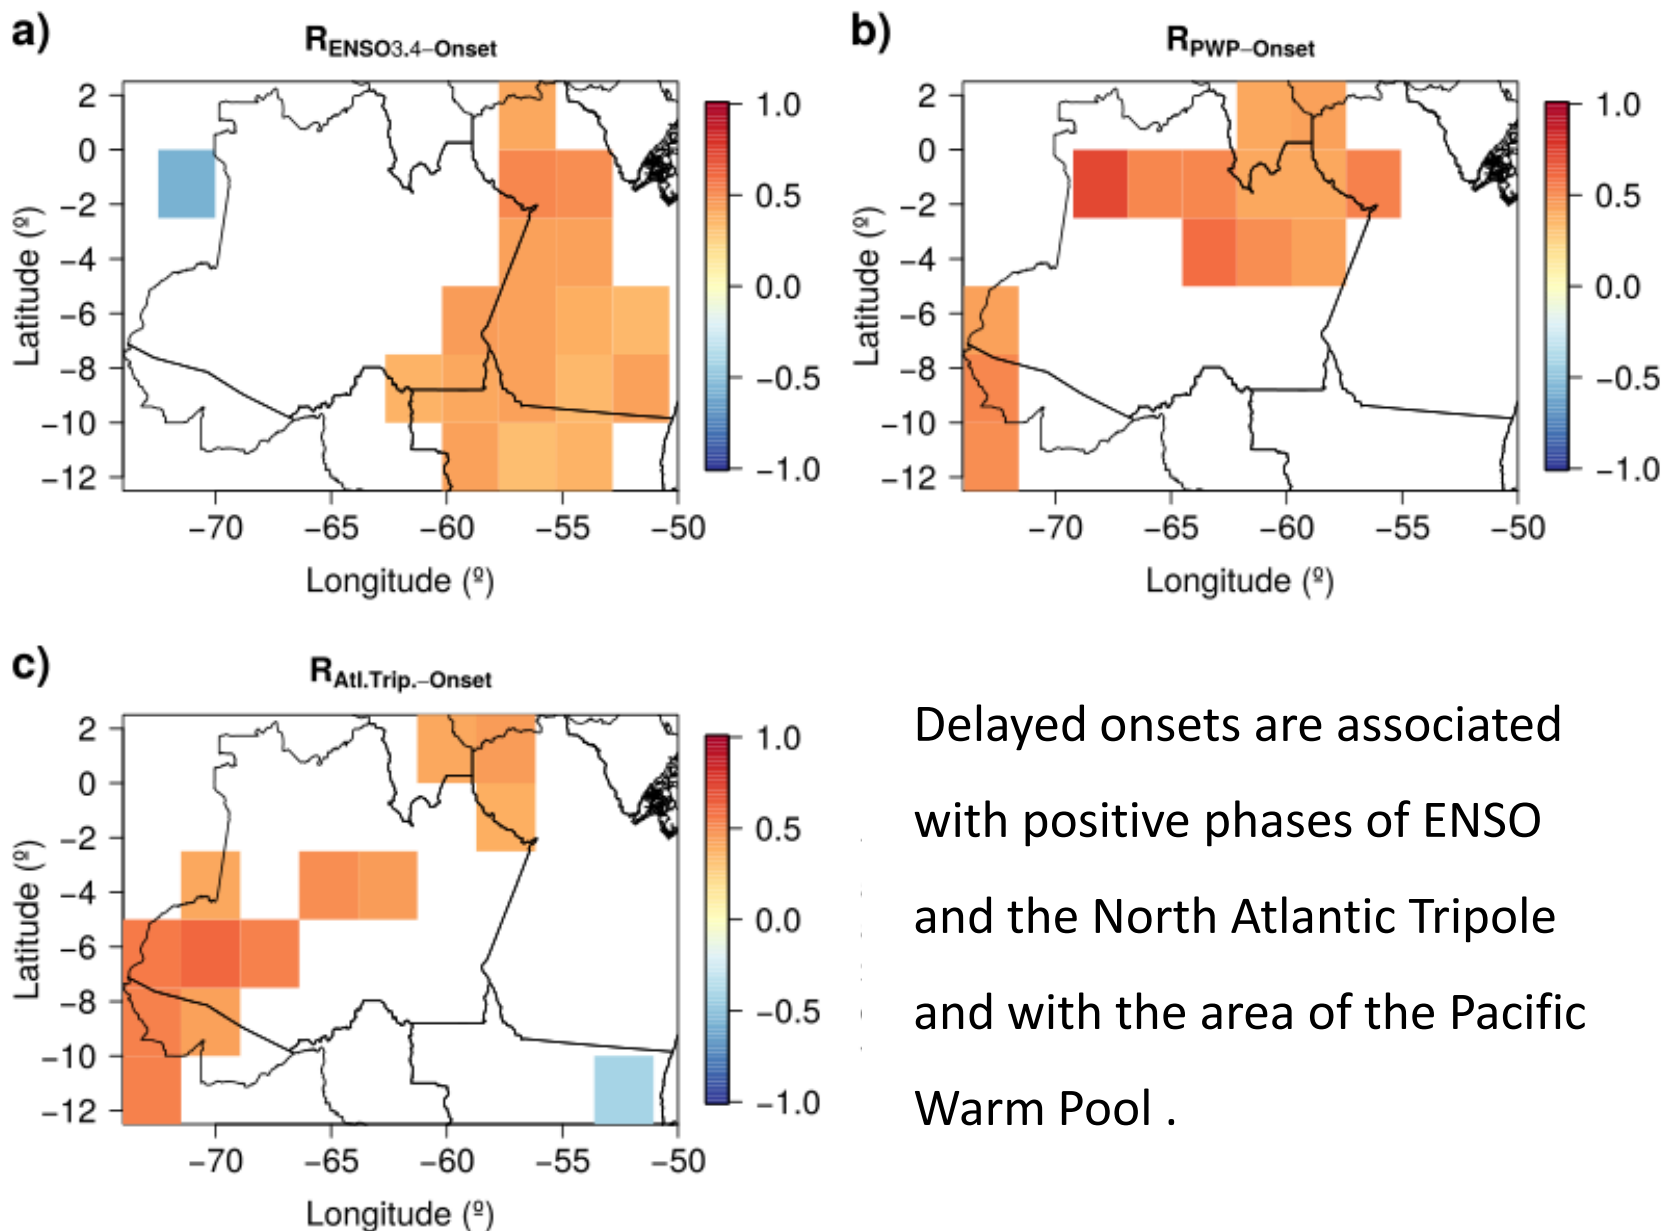

Correlation between detrended time series and CFmax or CFmin

- **Northern Amazon:** El Niño and fcmin, fcmax reduction
- **Southern Amazon:** El Niño and fcmin increase
- Positive Anomalies in the N. Atlantic Tripole - fcmin reduction

Correlation between detrended time series

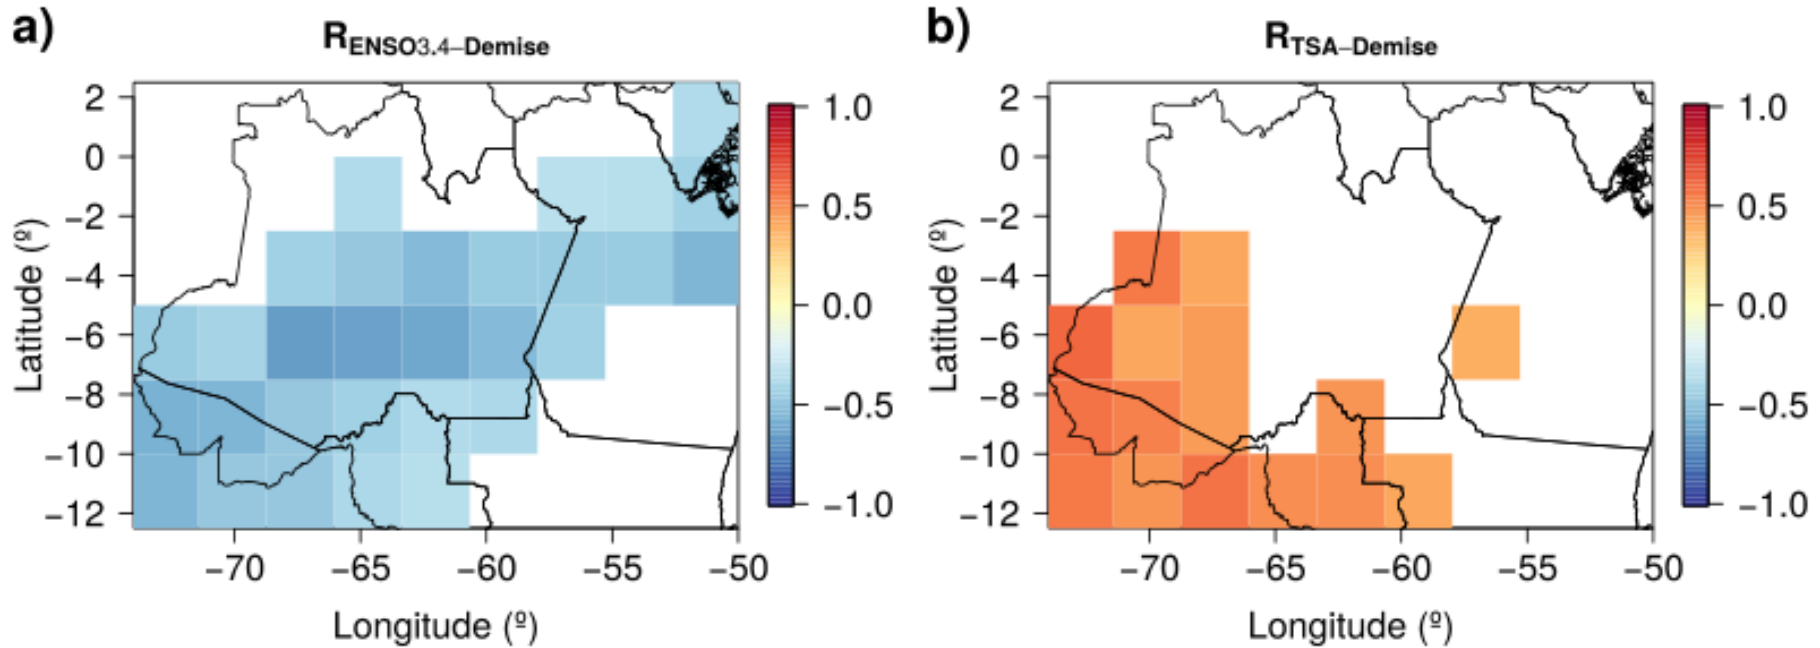

Wet season onset

Delayed onsets are associated with positive phases of ENSO and the North Atlantic Tripole and with the area of the Pacific Warm Pool .

Correlation between detrended time series

Wet season demise

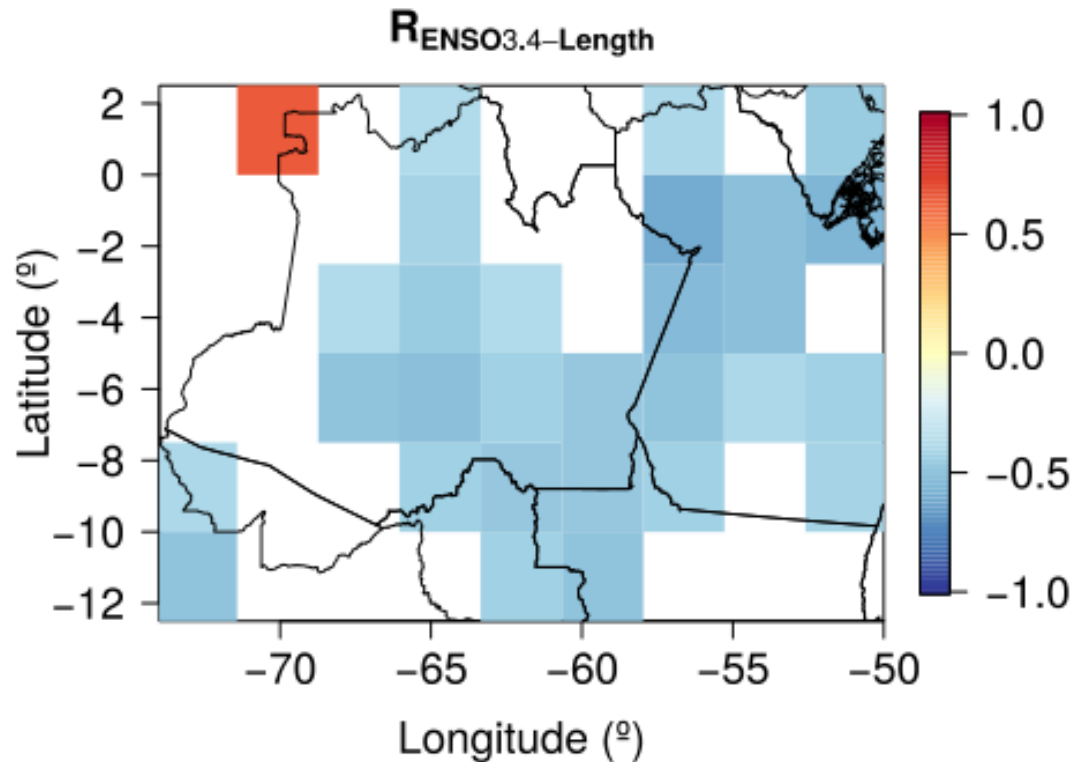

Links between:

- Earlier demises and El Niño.
- Delayed demises and positive anomalies of SST in the Tropical South Atlantic (TSA).

Correlation between detrended time series

Wet season length

Link between:

- Shorter wet seasons and El Niño.

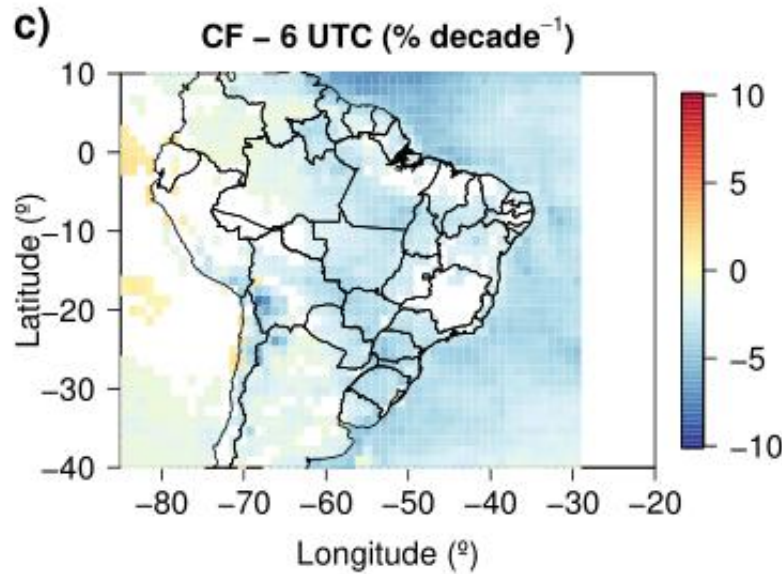

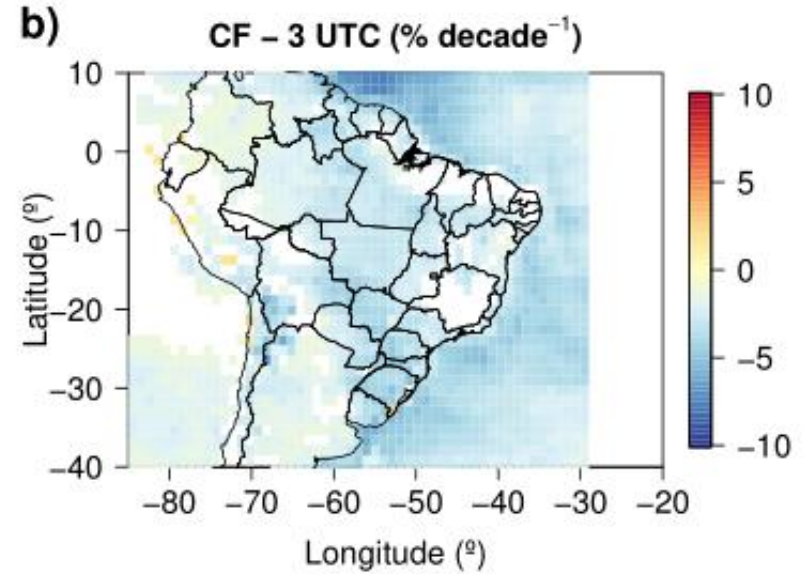

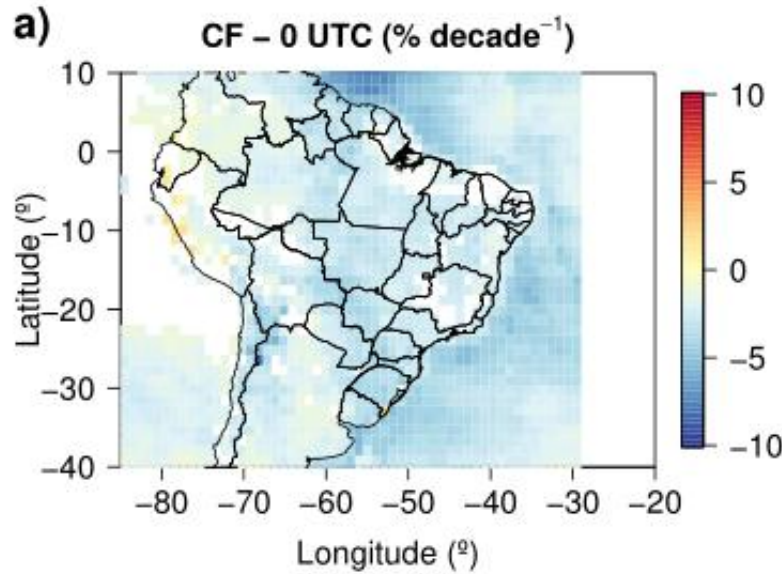

- ENSO dominates interannual cycle of precipitation
- Modeling needed to understand long-term trends (AMO, PDO, etc.)

Ongoing work:

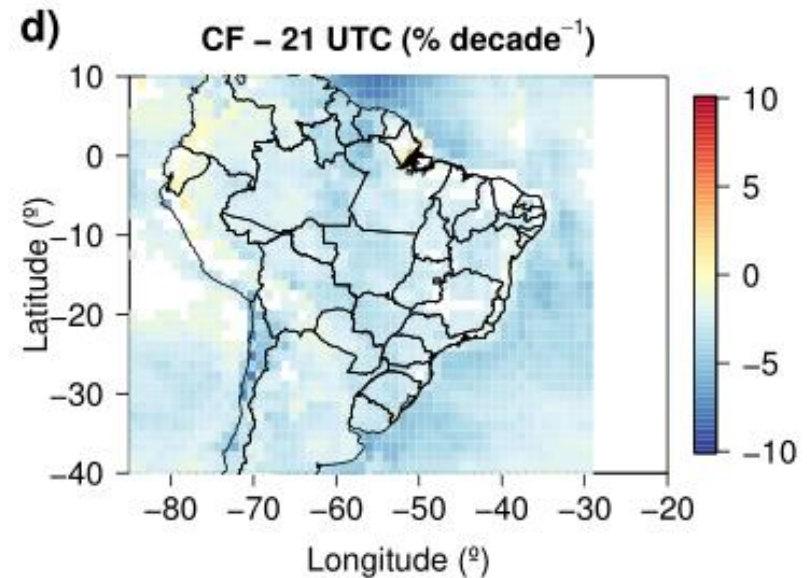

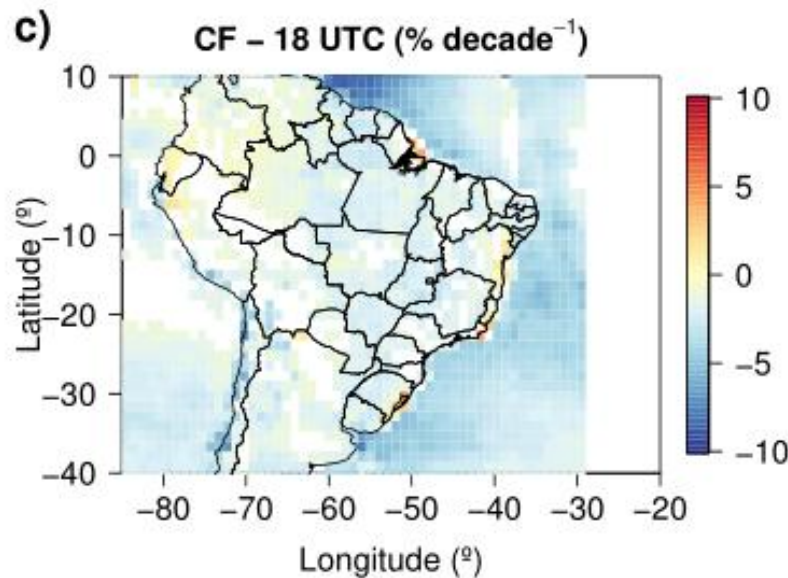

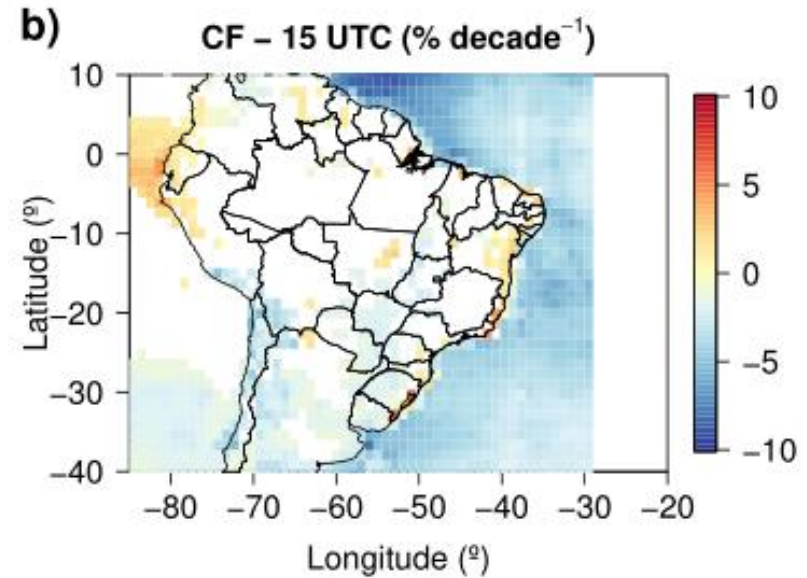

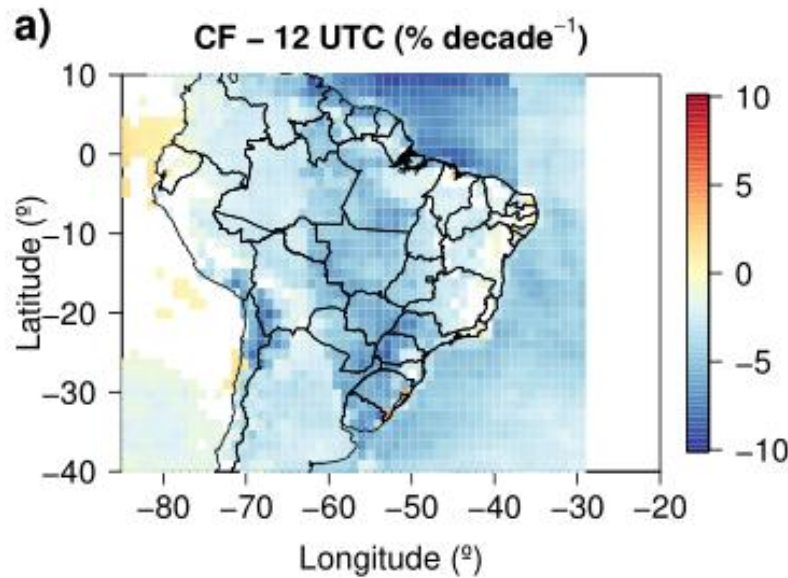

CNPq Universal Project

**Long-term variability of the cloud life cycle
and their impacts on solar energy
and water availability**

Linear trends of total cloud fraction (1983 – 2015)

Linear trends of total cloud fraction (1983 – 2015)

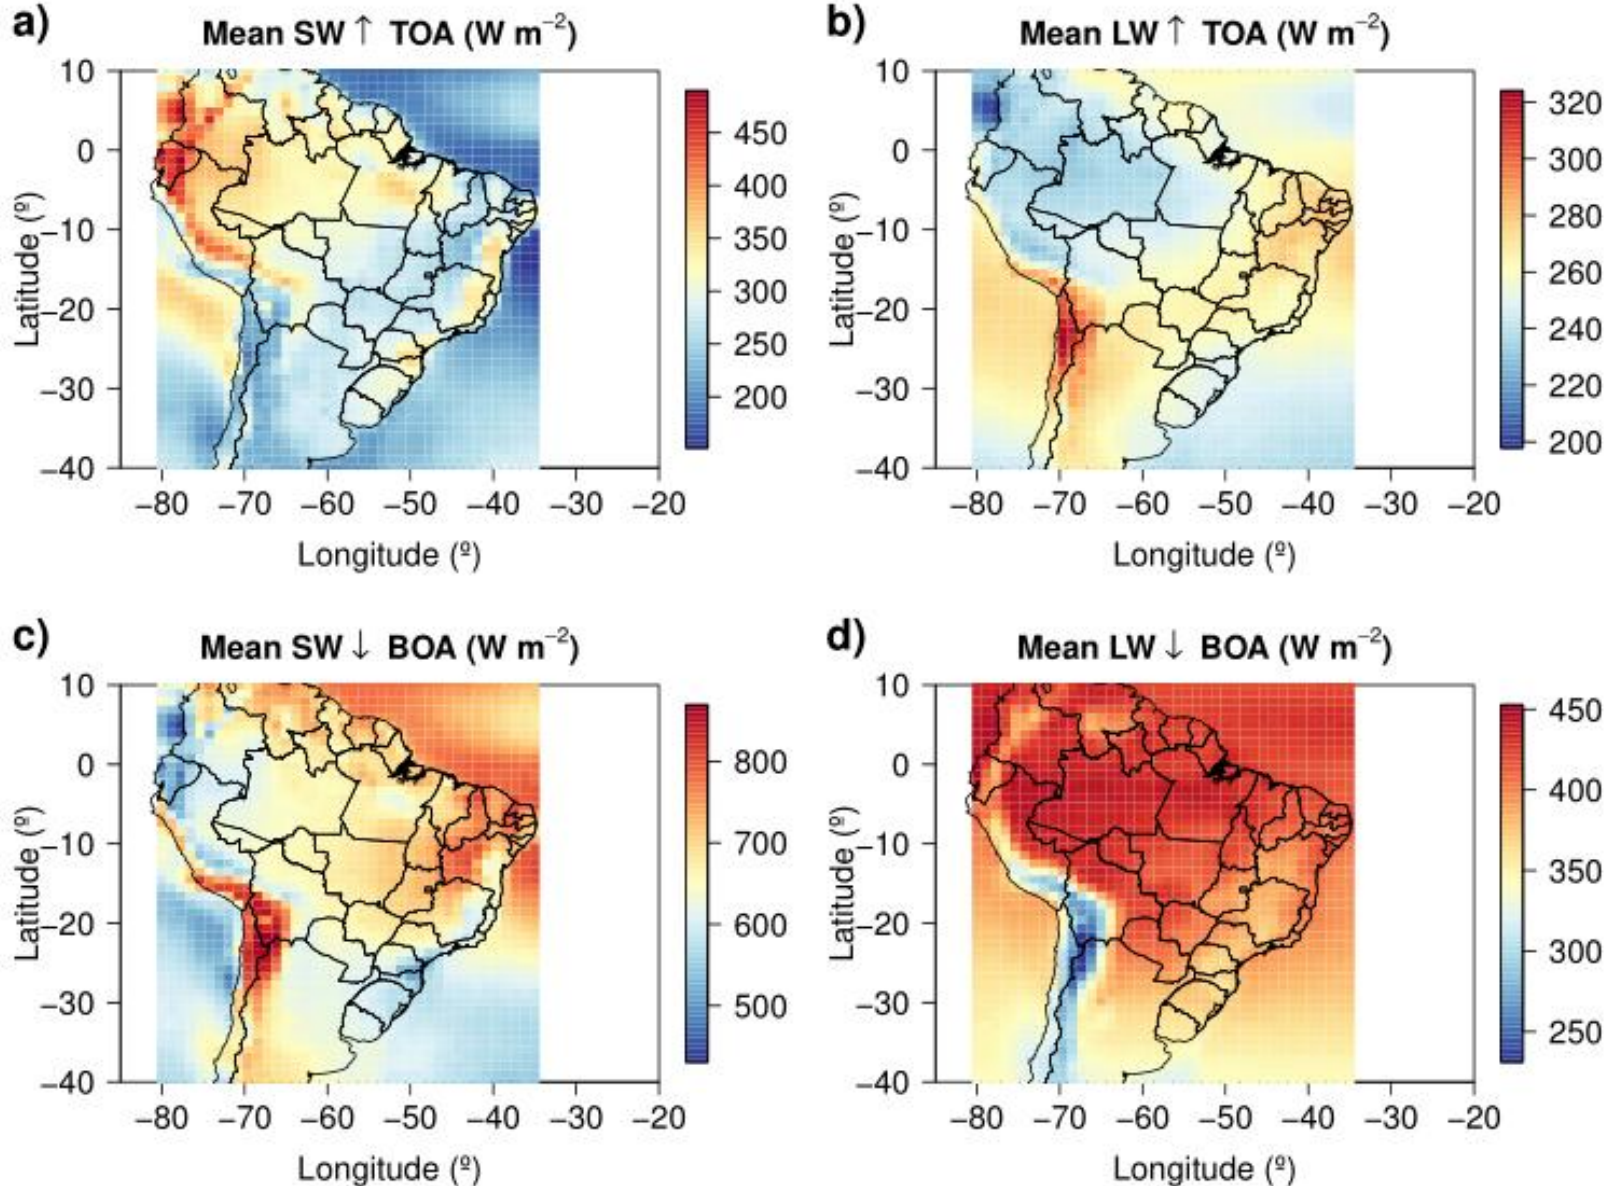

CERES (2000 – 2016)

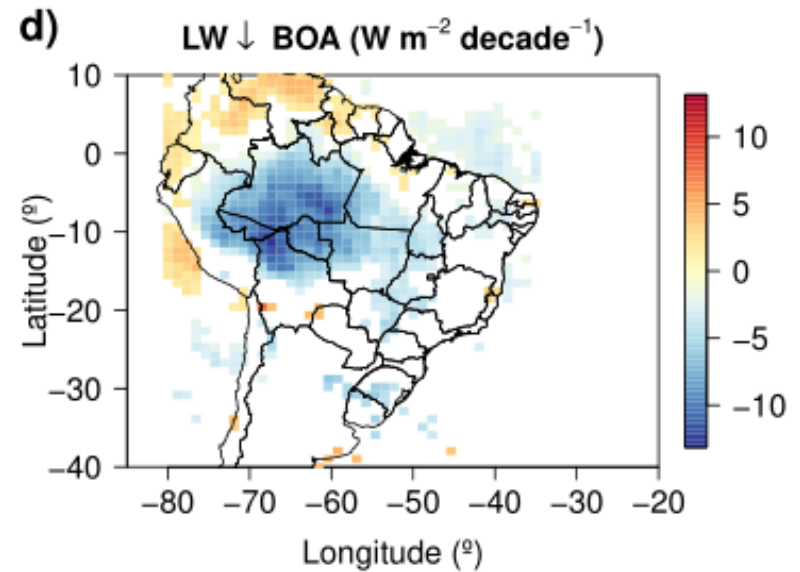

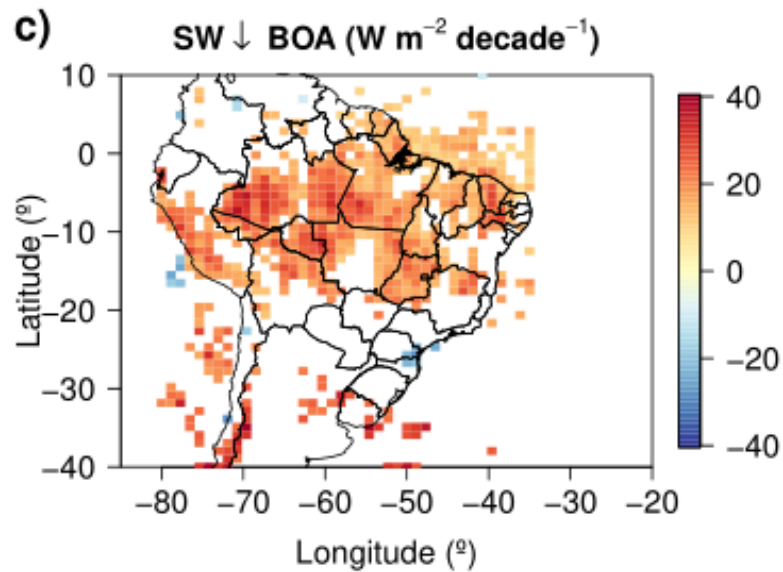

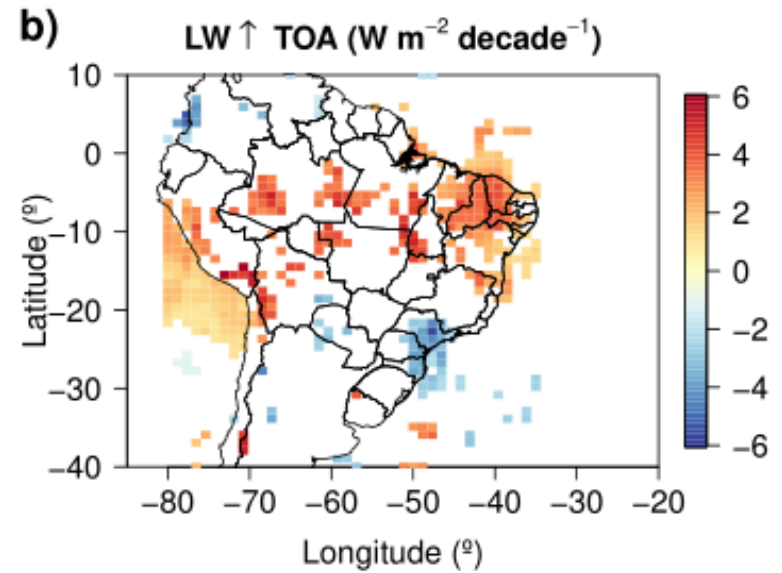

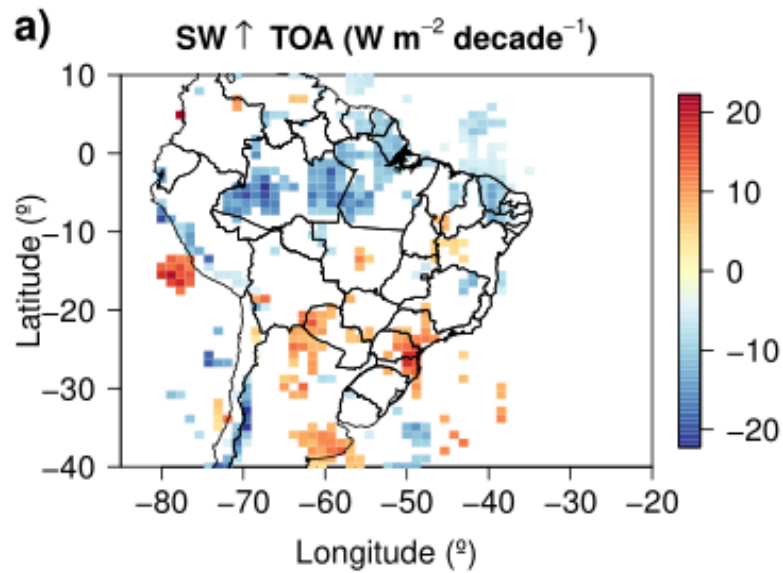

Trends at mean time pass \pm 15 minutes

Mean Irradiances by CERES (2000 – 2016)

Linear Trends of Irradiances by CERES (2000 – 2016)

Summary

- A new methodology to assess the rainy season onset and length in Amazon is proposed.
- The results show shorter wet seasons and earlier onsets, especially in Eastern Amazon likely linked to large-scale phenomena.
- This study provides strong evidence of the influence of ocean-atmospheric interactions on Amazon's rainfall regime.
- There is a consistent reduction of cloud fraction over the study area which significantly modifies Amazon's energy balance and thermodynamics.

Summary

- A new methodology to assess the rainy season onset and length in Amazon is proposed.
- The results show shorter wet seasons and earlier onsets, especially in Eastern Amazon likely linked to large-scale phenomena.
- This study provides strong evidence of the influence of ocean-atmospheric interactions on Amazon's rainfall regime.
- There is a consistent reduction of cloud fraction over the study area which significantly modifies Amazon's energy balance and thermodynamics.
